What do you understand about the work and finish line?

My job is to use what I learned from the videos to plan, build, and test a small interactive project. For my driving game idea, I would start with one car, one track, and checkpoints. My goal would be a playable version where the player can steer, brake, and reach the finish. My plan might change if I don't have enough time and my idea or plan is unrealistic. I also need to document my plan, record testing and improvements, and upload my work and required evidence to my personal GitHub repository. For Action 12A, I am preparing my notes, contribution, and plan before building.

What will you contribute? Name a task or useful capability.

I am working solo, so I will handle the planning, building, testing, and documentation. I bring an interest in cars and ideas for designing a fun driving challenge. I will start with one track, set up the car and checkpoints, and test the controls. I am still learning Unity, so I will use the tutorials and feedback to improve my work. I will work my hardest to make my plan come true and not just feel like it's an unreachable plan.

What needs research, support or practice?

I still need to learn more about Unity and become comfortable using it. I have gotten comfortable with VS Code and Visual Studio, but Unity is new to me, so I need more practice with its tools, scenes, and project setup. I plan to review the tutorials and try small examples before building my game. I also want to figure out how to set it up on my MacBook so I can save my progress and continue working outside of class.

Your available work times and preferred contact method: Discord, email, text, classroom or other. Keep private addresses/numbers outside public exports.

Preferred contact: Classroom

My phone number is 909 414 9844

List your project tools and why you need them.

I plan to use Unity to build the track, add the car and camera, and test my driving game. I will use VS Code to write and edit C# scripts for the controls and checkpoints. Git will help me track changes, and GitHub will store a backup and let my professor review my work. I will also use a game development document to organize my story, tasks, and goals. ChatGPT can help explain confusing concepts and suggest fixes, but I will review and test its suggestions before using them.

Required: name the AI you will use, its project task and how you will verify its output. Use course-provided/shared or approved local access if needed; no personal or paid AI account is required.

AI: Chat GPT

Task: It will be my teammate it will help me when im stuck and give me ideas with my game.

Verification: This is my most reliable source in my opinion
